

This is a sample PDF document created for testing the AI module pipeline. It contains multiple sentences so that the chunking logic has enough content to split into several chunks. The purpose of this document is to verify that text extraction using pypdf works correctly, and that the chunker splits the extracted text into pieces of roughly 500 to 1000 characters, respecting sentence boundaries wherever possible. Once chunking is verified, these chunks will be ready to be passed into the embeddings module for vectorization, and eventually stored in a vector database such as FAISS or Qdrant for semantic search and retrieval. This concludes the sample content for Day 1 testing purposes.
